

SpaEase™ 200

Hot Tub Cover Lifter

STEEL/ALUMINUM CONSTRUCTION

Built to the Highest Quality Standards the SpaEase 200 is the only hot tub cover lifter that uses steel where it's needed, and aluminum where it's required.

STEEL

The arms are constructed of steel to minimize damage from wind and/or overweight covers that become water logged.

ALUMINUM

The Mounting Bracket utilizes an aluminum gauge nearly twice the thickness of competitors providing a smooth and sturdy movement.

The SpaEase weighs on average 40% more than traditional lifters and is designed to last twice as long.

EASY TO OPERATE PLUS ENERGY EFFICIENT

Dual gas pistons utilize our exclusive "Reverse Pneumatic Technology (RPT)". The pistons assist in raising the cover and once it's half way up RPT takes over and does all the work. The RPT system also assists you in closing the cover, and once closed, it applies a gentle downward pressure to keep the cover sealed, helping to minimize heat loss.

BUILT TO LAST LONGER

To prevent against unintentional closings, similarly designed cover lifters require you to lock the lifter when the cover is up. Closing the cover without disengaging this lock causes damage to the piston and/or lifter. The SpaEase 200 has a built in safety stop and does not require the burdensome use of locking devices. Its unique design, in itself, helps prevent against unintentional closings.

LIFTING HANDLE CONVERTS TO ROBE / TOWEL HOLDER

To make operating your cover easier the SpaEase is the one of the only lifters that provides a convenient handle that can be installed on either side. An optional handle is available for those that prefer handles on both sides. This textured handle provides the perfect place to hang your robe or towel while you enjoy your spa experience.

LIFTER/CABINET LOCKING DEVICE

For added security and protection in heavy wind areas, we offer the only device that locks the lifter to the spa's cabinet. It works independently or in conjunction with the standard locks on your cover. It comes as a pair for either or both sides of the lifter and works on both the SpaEase and the VacuSeal Lifters.

PROFESSIONAL APPEARANCE

After the cabinet and the cover, the lifter is the most visible part of your hot tub. For that reason we apply a very attractive and most importantly durable finish to the lifter and cover all the screws with plastic caps. But more importantly, we've designed a full cover plate that sits over the bracket, giving the SpaEase a professional, clean and attractive appearance.

ALLOWS FOR ADJUSTMENT

Some cover lifters work well on small spas, where others perform better on large spas. The SpaEase is truly universal. Multiple points of attachment on the lifting arm allow for easy adjustment to whatever size spa cover you own (up to 96" x 96"). These adjustment points even allow you to vary how far the cover rests from the spa when it is opened. Extended support arms are available on radius corners that exceed 12".

EASILY CONVERTS TO A VACUSEAL

The SpaEase is simple to install and easy to operate. It also has a brother called VacuSeal, that is a revolutionary cover and lifter system that opens in one simple motion and provides maximum energy efficiency. The SpaEase, with the use of a conversion kit, can be transformed in a matter of minutes into a VacuSeal. For those who just need a cover lifter, the SpaEase is the perfect choice. And if you later decide to upgrade your traditional cover to a VacuSeal, you'll be happy with both the price and ease of conversion.
